Aladin was originally designed to visualise astronomical data in terms of spatial coordinates. Based on the same technology, we have incorporated a new dimension in Aladin: the time. A new Aladin **prototype**, based on the core of Version 10, incorporates **two new components**: a “time view” window and a “time coverage” capability.

Time view

Vmag vs epoch observations for Tycho2 objects around Orion

The “Time View” window is a simple extension to Aladin’s graphic window originally designed to handle longitude VS latitude plots. This new graphic mode is now capable of **drawing scatter plots** where the primary axis is time and the secondary axis is selected by the user and could use any of the accessible quantities like magnitude, flux, radial velocity, etc. This new graphic mode is **fully interoperable** with Aladin’s spatial window so selected objects markers are visible on both windows simultaneously.

First issue

How does Aladin discover the time system of a given entity (format, scale, offset, observer location) from the VOTables or FITS files? As of today, there is NO time meta information standard.

- Aladin prototype is using **heuristics** algorithms to “guess” the time fields and the associated reference systems. But this method is prompt to error.
- A **formal description** using a **TIMESYS** tag in VOTable standard would ease tremendously this problem.

VOTable format
Table J/ACA/58/163/catalog
-assuming Time column 15 (proba=90.0%) timesys unknown (assuming TDB/Barycentric)
-assuming RADEC in degrees column 1 for RA and 2 for DEC
[RA=0 (proba=100.0%) DE=1 (proba=100.0%) PMRA=-1 (proba=0.0%) PMDEC=-1 (proba=0.0%)]
-Coordinate system references found:
ID="J2000" => eq_FK5 Eq=J2000
=> RA/DEC coordinate conversion not required: ref="J2000" => FK5(J2000.0) to ICRS
-found CSV DATA (field sep=Tab record sep=nl)
-Found 3 lines CVS header with dash separator
-assuming Time format:JD timeOffset: 2450000.0

Table	Col	Name	Description	Unit	Debounce	UCD

Aladin VOTable heuristic parser log for J/ACA/58/163/catalog

Second issue

In order to ease interoperability, which reference time system should we standardize on?

- Aladin prototype uses **JD(TDB,Barycentric)**

Time coverage

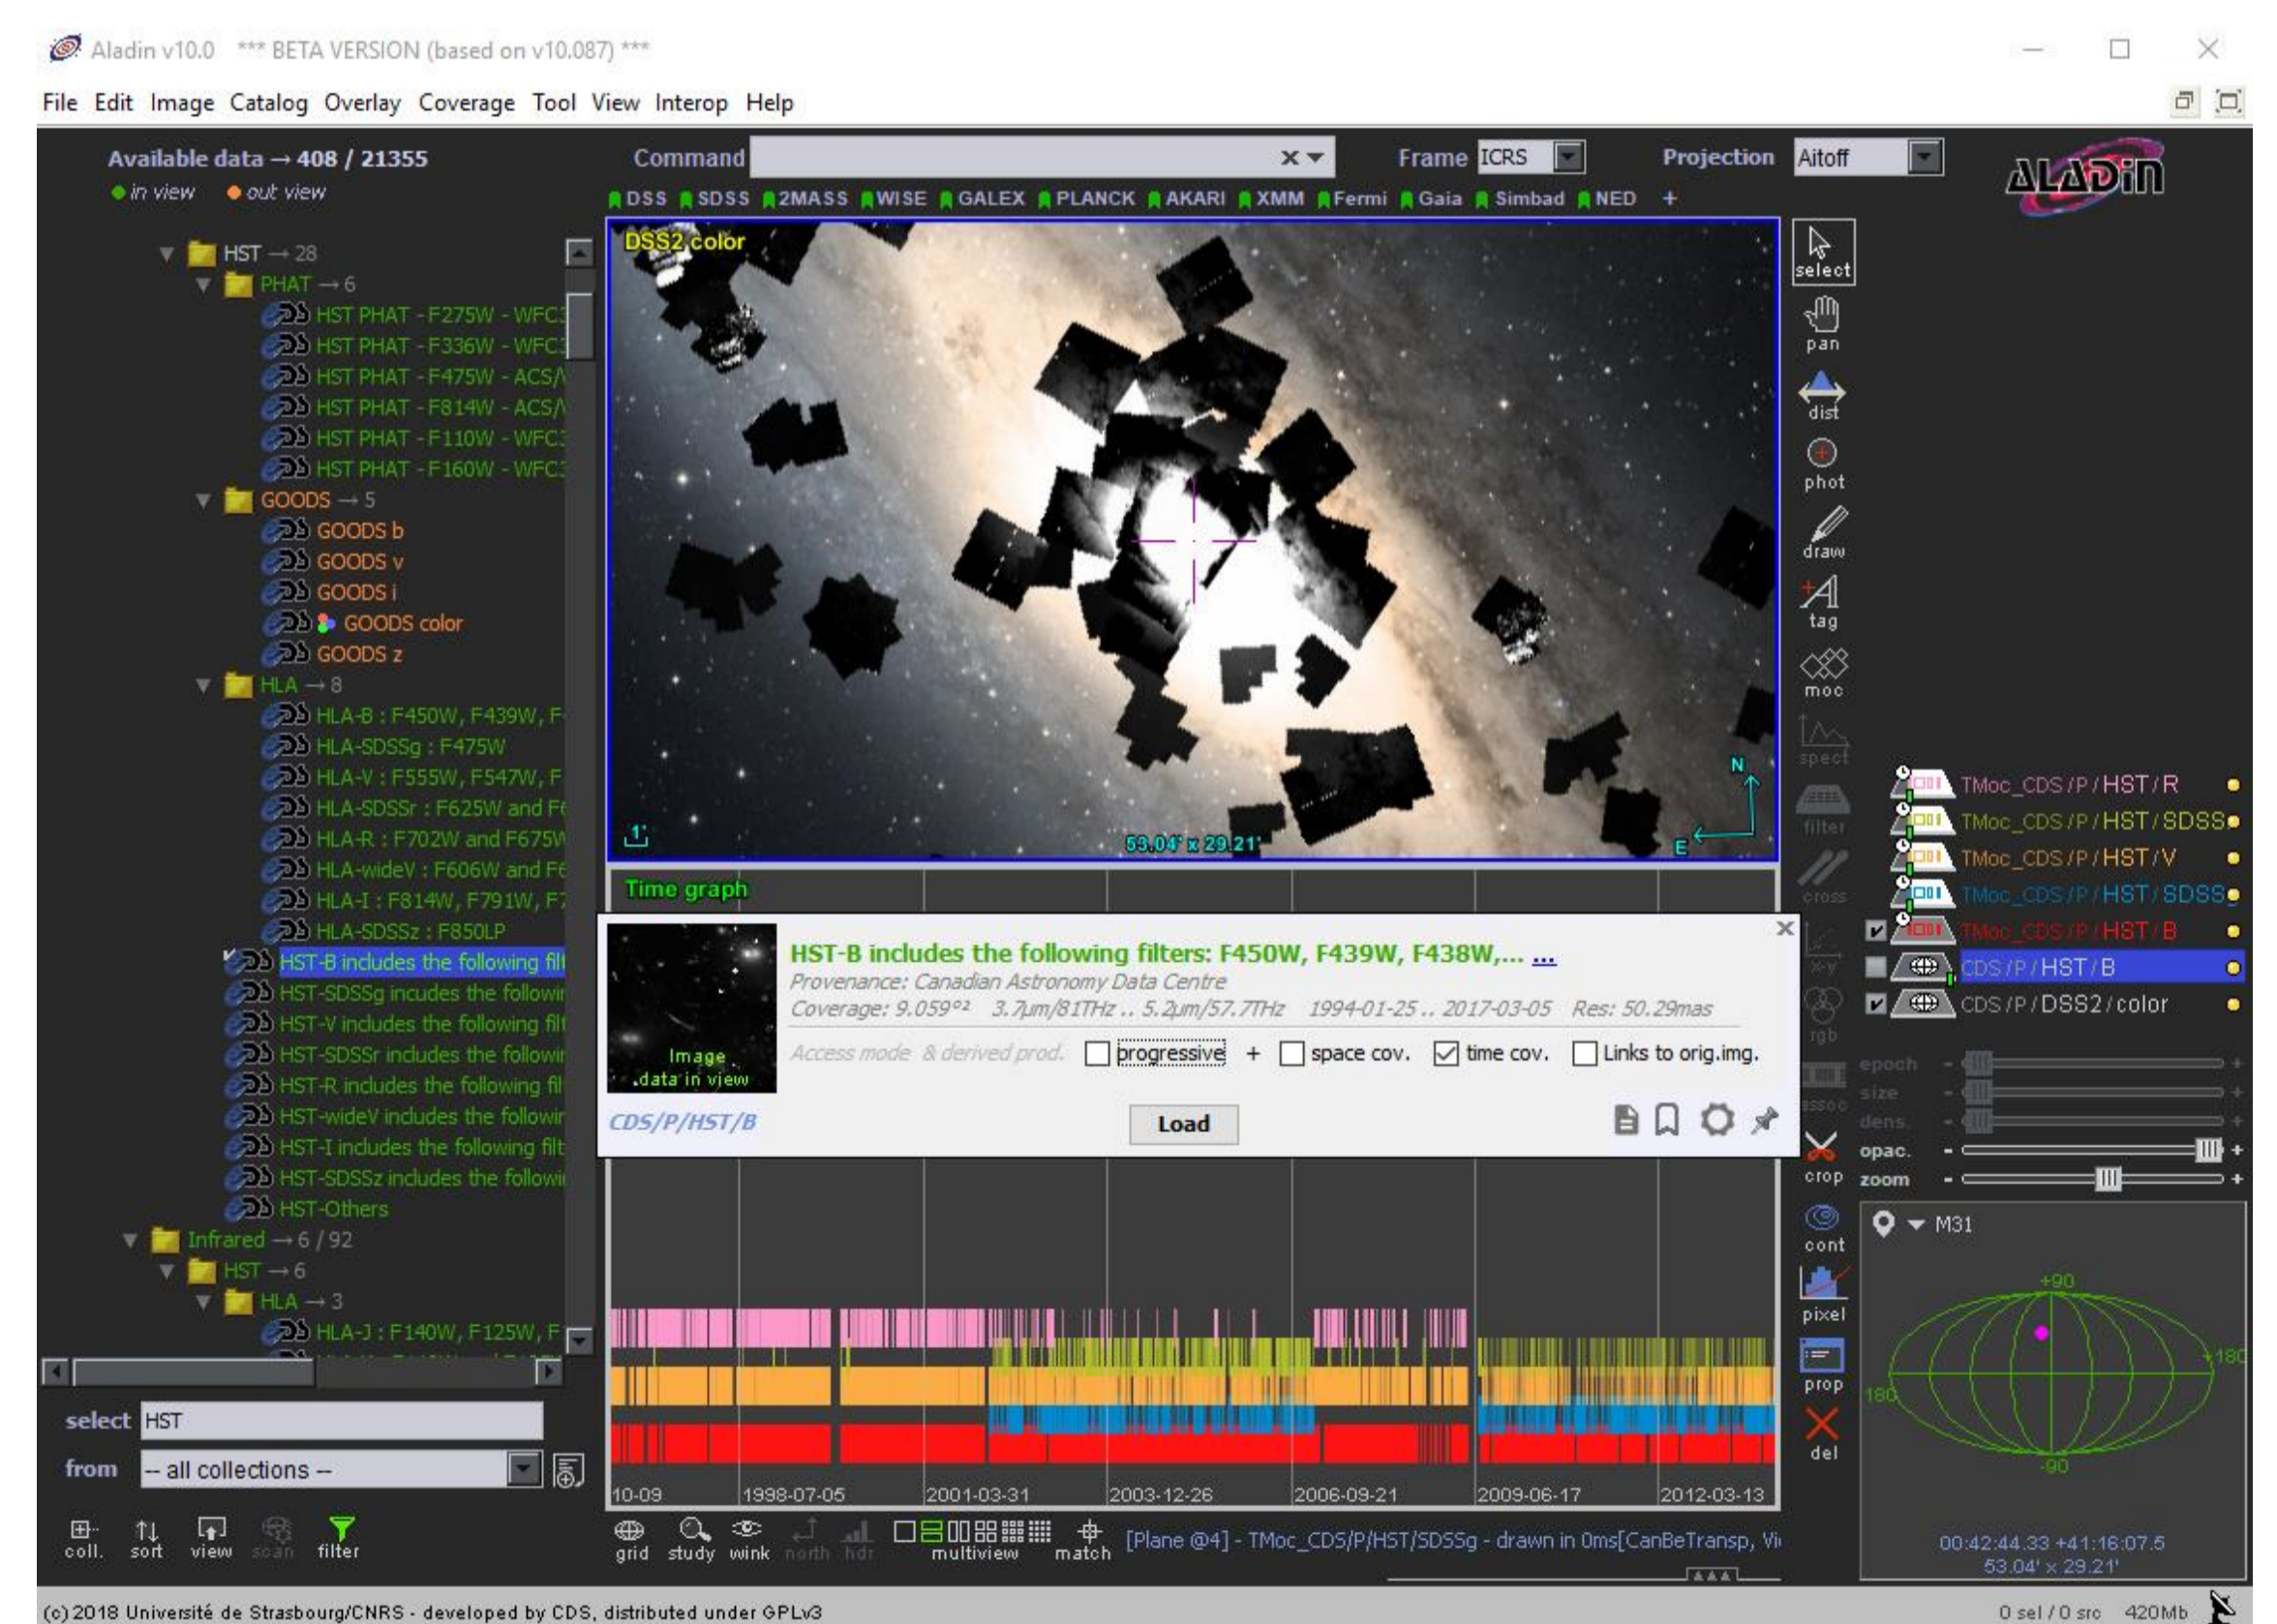

The “time coverage” capability is based on the technology supporting the Multi-Ordered Coverage (MOCs), replacing the HEALPix space **discretisation** with a **time scale** instead. Thus the user is then able to manipulate the time coverage the same way he/she was able to manipulate the space coverage using the standard Aladin. So the user can perform time coverage manipulation like intersections or unions of different time coverages, generate new time coverage from catalog. For this to be possible, Aladin prototype is introducing a new version of MOC files dedicated for the time axis called **T-MOC**. Creating T-MOCs was made possible with a very simple modification of the basic MOC java library.

Third issue

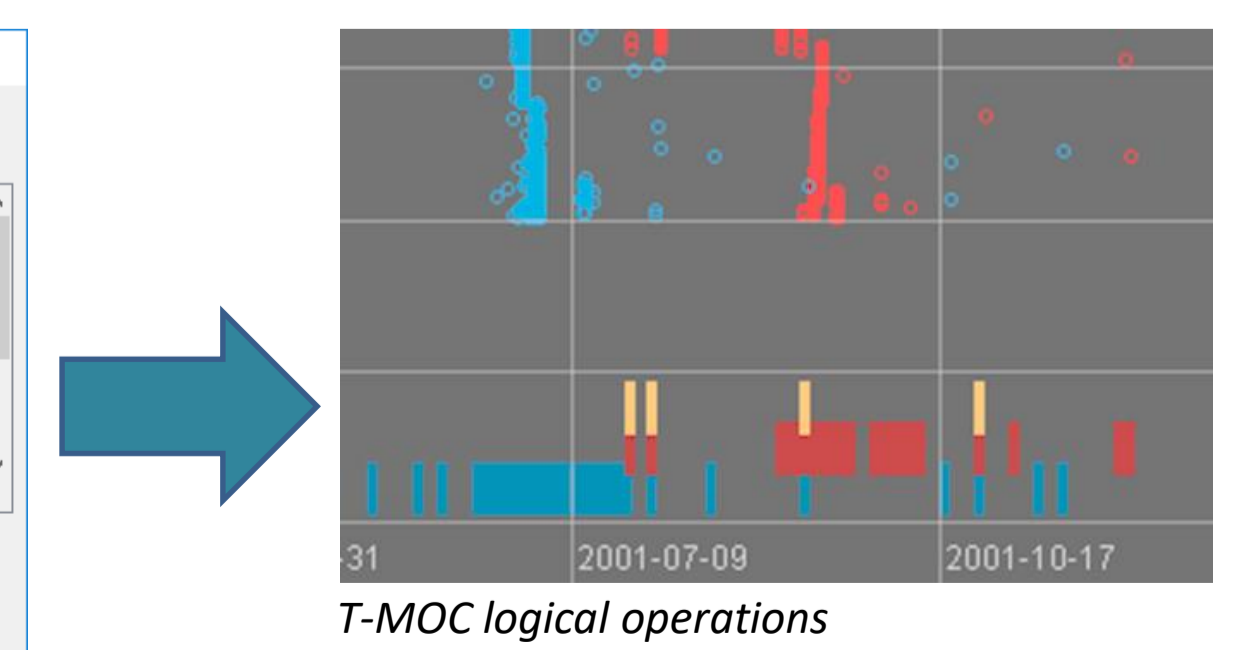

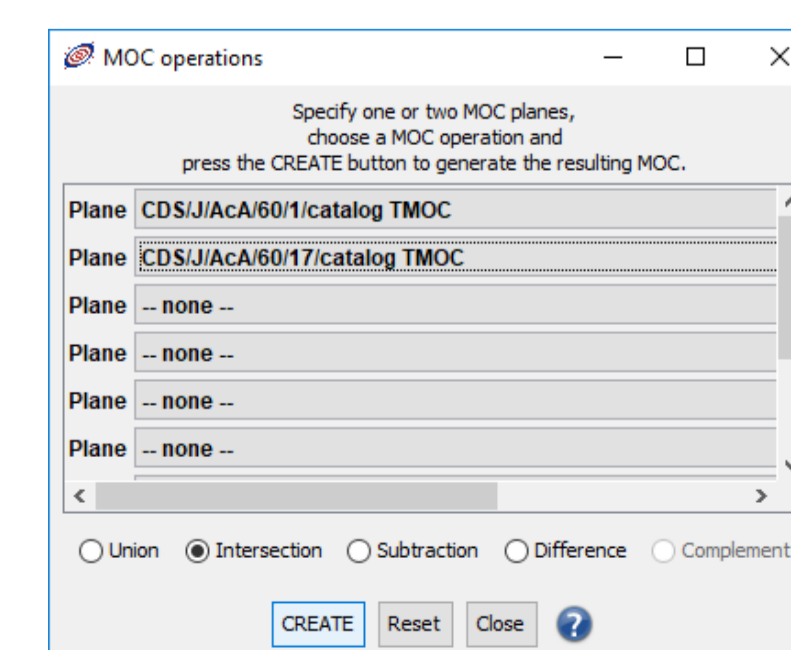

What are the **standards** we should use to produce T-MOC which are interoperable?

- Using **JD(TDB,Barycentric,no offset)** => requires Time conversion library
- Using **1 μs** for **order 29** T-MOC resolution hence covering **9133** years if we use JD=0 (Monday, 4713 B.C. Jan 1, 12:00:00.0) as a starting point.

Note: for unknown system, the T-MOC will be created at a lower resolution for covering the system imprecision (typically 16min)

T-MOC comparison for HST image collections: HST-B, HST-V, HST-R, HST-SDSSr, HST-SDSSg

These new capabilities are **already implemented** in the Aladin Beta version available on the Aladin CDS Web site <http://aladin.u-strasbg.fr>
